OBJECTIVE

I am a pre-final year B.Tech student in Information Technology with a methodical approach to building and testing software. I tend to plan before I execute, which I have found genuinely useful when working through edge cases or debugging logic issues in my projects. I am looking to start my career as a Software Quality Analyst where I can apply my technical foundation in programming, SQL, and APIs while learning professional QA practices in a real product environment.

EDUCATION

B.Tech — Information Technology | Dr. APJ Abdul Kalam Technical University

2023 – Present | CGPA: 8.0

CBSE Class XII — Maa Durga Ji Vidyalaya, Jaunpur | 2022

CBSE Class X — Maa Durga Ji Vidyalaya, Jaunpur | 2020

TECHNICAL SKILLS

Languages: C, C++, Java, Python, JavaScript

Web: HTML, CSS, Node.js, Express.js

Database: SQL — writing queries, joins, subqueries, aggregations

APIs: REST APIs — basic understanding of requests, responses, and status codes

Testing: Manual test case design, bug identification and reporting, defect lifecycle

Tools: Git, GitHub, VS Code

Familiar with: AWS (basic), Postman (API testing)

CERTIFICATIONS

- SQL Certificate — HackerRank (covering SELECT queries, JOINS, aggregations, nested queries)
- DSA Problem Solving — LeetCode (100+ problems solved across arrays, strings, recursion, and searching)

PROJECTS

Live Hospital Status Tracker | HTML, CSS, JavaScript, Node.js, Express.js

- Built solo — a real-time web app that shows live hospital bed availability and doctor schedules.
- The hardest part was handling real-time updates; spent considerable time debugging event flows and ensuring state consistency across concurrent requests.
- Tested all major user flows manually — searched for edge cases like empty data states, delayed responses, and incorrect inputs before considering it done.
- Gave me hands-on understanding of how a bug at the backend quietly breaks UI behavior, which shaped how I now think about testing.

Spam Email Detection — ML Classifier | Python, Scikit-learn, Pandas, NumPy

- Built a classification model to identify spam emails using NLP and machine learning techniques.
- Focused on data quality during preprocessing — noticed that dirty data had a bigger impact on results than model choice.
- Evaluated the model across different test splits; tracked precision, recall, and false-positive rate to ensure it performed reliably.

POSITIONS OF RESPONSIBILITY

Technical Coordinator — GeeksForGeeks Student Chapter

- Organised 4–6 technical events including a hackathon — handled everything from planning the format to coordinating on the day.
- The hackathon specifically taught me a lot about working under pressure and keeping things on track when things go off-script.

Coordinator — WIWA (Anchoring Club)

- Anchored and managed college cultural events; built confidence in public speaking and handling live, unplanned situations.
